PREFACE

This is the final tabulation of statistical data relating to vital events in Missouri during 1972. Data for the year of the report is accepted through March 15 of the following year before it is cut off, allowing information reflecting events in that year to be as complete as possible.

The annual report of Missouri Vital Statistics was compiled for use in public health and related fields as an aid for studying births, deaths, fetal deaths, marriages, and divorces. Provisional vital statistics data are available through the publication, Monthly Vital Statistics. Unpublished detailed annual vital statistics data are available upon request.

BACKGROUND

RELIABILITY OF THE DATA

In analyzing any data, the fact of potential error in the data must not be overlooked. There are several types of errors possible including: underregistration, errors made by the informant, and errors in compiling and processing.

Probably, the most potentially dangerous error is that of improper interpretation. Statistics are neither more true nor false than the interpretation given to them. Particular caution must be made in analyzing trend data, for there have been changes over the years in medical diagnosis, coding definitions, and registration coverage. Most of the rates computed in this report are crude rates. In comparing geographic areas, crude rates are limited because they do not take into account the differences in age, sex, race, and other population characteristics. Care should also be taken in using rates where the number of events or the population is small. Minor variations in the number of events may result in major changes in the rates.

VITAL RECORDS

Vital Statistics in Missouri are compiled from five basic records which are filed with the Division of Health by State Law. These records are: (1) live birth records, (2) death records, and (3) fetal death records, each beginning with 1910; (4) marriage, and (5) divorce records, beginning with 1948.

Missouri cooperates with other states in the exchange of records for live births, fetal deaths, and deaths to include in resident data events occurring to Missouri residents in other states.

The data within this report represents the 1972 calendar year of events. Records have been accepted through March 15 of 1973 before cut-off, allowing 1972 events to be as complete as possible.

POPULATION

Population data in this report is a Provisional Estimate of Population, July 1, 1972; provided by the DEMOGRAPHIC UNIT, Division of Management Systems, Office of Administration, 14th floor, Jefferson Building, Jefferson City, Missouri.

RATES

Rates are calculated by dividing the event of concern by the population at risk or a related population and multiplying by a constant. Death rates from all causes and live birth rates are expressed in terms of 1,000 estimated population; deaths from a specific cause are based on 100,000 estimated population (excluding maternal and infant causes); maternal deaths calculated per 10,000 live births; infant, neonatal and fetal deaths stated per 1,000 live births.

COLOR

The term "color" refers to the division of population into two groups, white and nonwhite.

The color group designated as "nonwhite" consists of such races as the Negro, American Indian, Japanese, Chinese, Filipino, Korean, Asian Indian, and Malayan races. Persons of Mexican birth or ancestry who are not definitely of Indian or other nonwhite race are classified as white.

Persons of mixed racial parentage are classified according to the race of the nonwhite parent.

TERMS "RESIDENT" AND "RECORDED"

It is important to understand the significance of the terms "Resident" and "Recorded" when analyzing vital statistics.

"Resident" data are compiled for vital events that relate to persons residing in an area independent of where the events occurred. (A person is considered to be a resident of an area if he has resided there six months or more. In the case of live births, fetal deaths, and infant deaths, the residence of the mother is considered to be the residence of the child.)

"Recorded" data are based on the number of vital events that occur in an area. These data are used to analyze events that might be affected by the place in which they occur.

Resident and recorded figures can neither be added nor subtracted from the other. Thus the number of events occurring or not occurring in the same geographic area where the people reside cannot be calculated from resident and recorded data.

CAUSE OF DEATH CLASSIFICATION

The causes of death presented here are classified in accordance with the Eighth Revision of the International Classification of Diseases, Adapted, 1967; Public Health Service Publication No. 1693, from the U. S. Government Printing Office.

The specific causes of death in this report are shown in groupings of 41 causes. Where the leading causes were selected, it was done so from a further consolidation of these 41 causes.

RATES AND WHOLE NUMBERS

Rates are rounded to the nearest tenth. When the rate or percent is less than one-tenth, the entry is left blank.

In the case of whole numbers, if a blank or dash (—) is shown, this means none or zero.
